- **Even on highly trusted sites that are used by billions of users, there are thousands of vulnerabilities and even though they try to close these gaps new vulnerabilities appear every day.**

- **Many hackers fail to pass 2FA and Message verification.**
- **Sites give certain trial rights but they also have a weak point but it is not as easy as it seems.**

- **I'm pretty sure no one can access an account with a somewhat strong password and 2FA.**
- **Renewing passwords regularly is also beneficial in every way.**
- **Maybe they won't be able to crack a strong password with Brute Force Attack for years.**

- **Maybe we can be hacked by phishing method. We can also protect our selves from this by not clicking on every link or on links that we don't know the content of which comes to our e-mail.**

- **You can only secure yourself, sites can not protect you.**
- **I would like to end my words with a quote from the movie**
- **Who Am I: 'No system is safe.'**
